The "anti-social" adolescent

The management of behaviour and character disorders in children and adolescents presents, perhaps, an even greater problem than in other age groups, for in the former the clinical syndromes are not necessarily fully developed; the symptoms have a multiple significance and the changing course of the pathological mental conditions renders the prognosis difficult.

So far as chemotherapeutic measures are concerned, unfortunately the psychiatrist has had to rely on the use of standard neuroleptics, sedatives and antidepressants which, although sometimes affording considerable therapeutic benefit, are unselective in action and used at the expense of certain side-effects on consciousness and intelligence, such as indifference and loss of initiative.

Research has been directed therefore at finding compounds with a greater specificity of action, particularly with regard to controlling such symptoms as impulsiveness, aggressive tendencies, thoughtlessness and psychomotor restlessness. One such compound is Neulactil* brand pencyprine which, so far, has been shown to exert the most significant effect on these target symptoms.

Thus Neulactil renders the patient more receptive to psychotherapy, makes teaching easier, and modifies the relationship with the environment in such a way that more value is placed on psychosocial exchanges.

Neulactil is available as tablets, two strengths of syrup and injection solution.

Detailed information is available on request from MAY & BAKER LTD, Dagenham, Essex.

Neulactil

"... the most active neuroleptic for personality and behaviour disorders"
